# STAINLESS STEEL

Stainless steel is a generic term for a group of corrosion resistant steels with a minimum of 10.5% chromium content. Other alloying elements are added to enhance their structure and properties such as formability, strength and cryogenic toughness.

These include metals such as:

- Nickel
- Molybdenum
- Titanium
- Copper
- Manganese

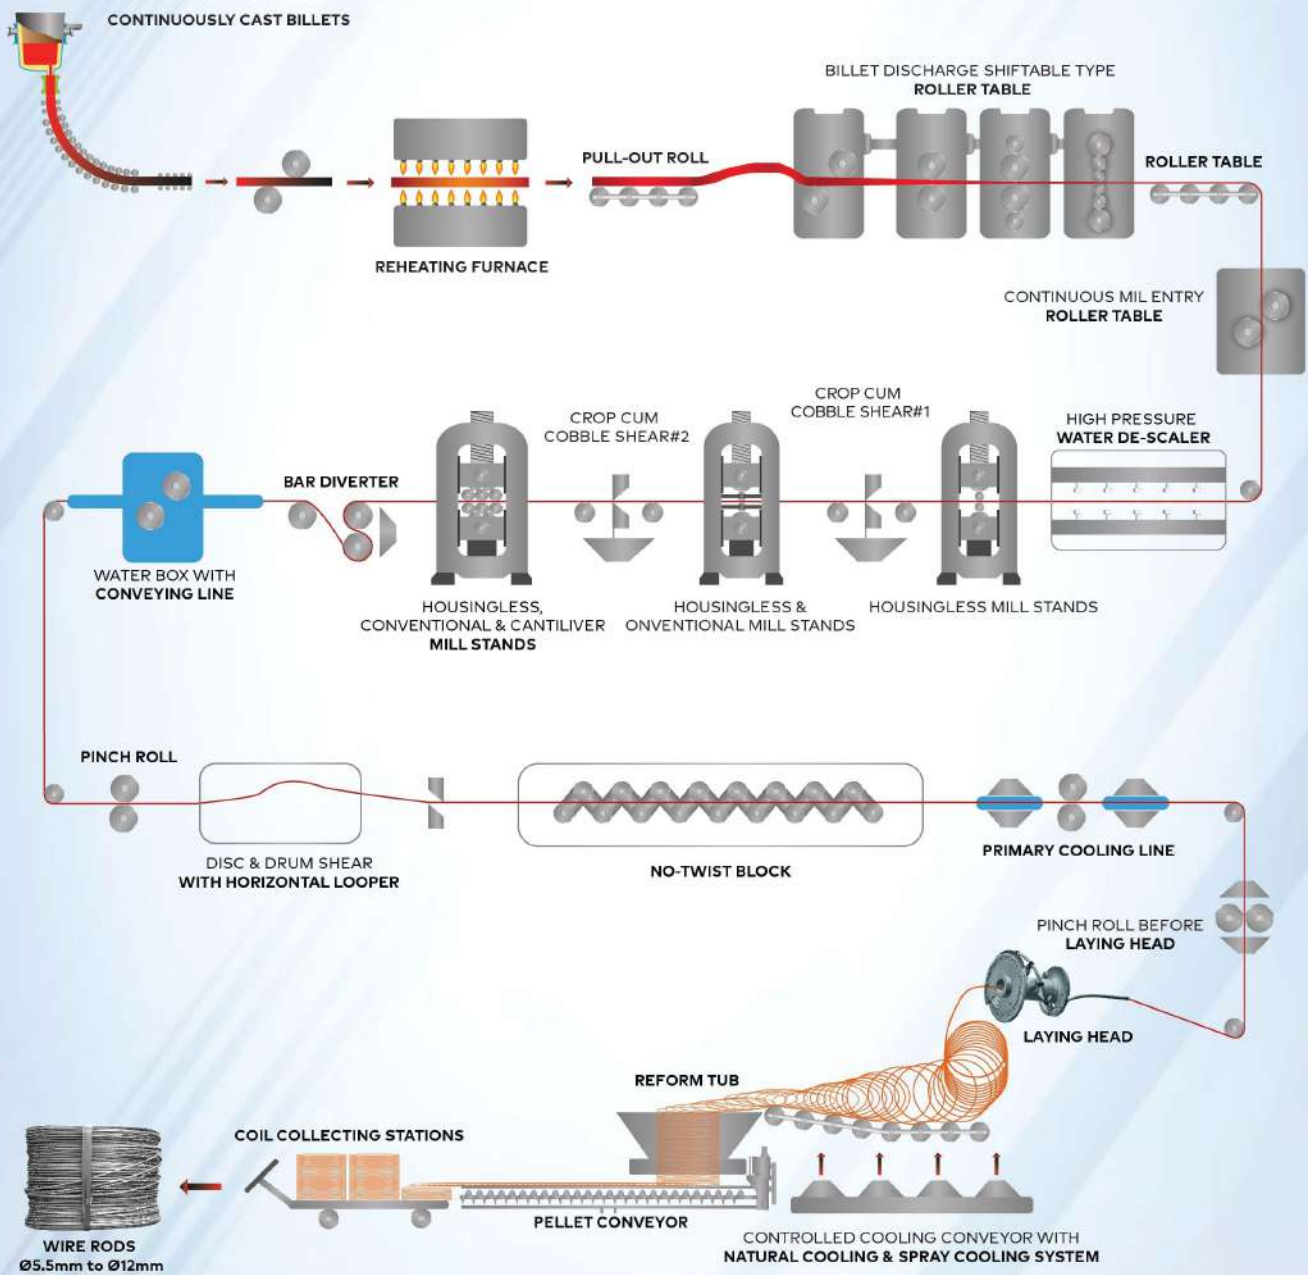

Non-metal additions are also made, and the main ones are:

- Carbon
- Nitrogen

The main requirement for stainless steels is that they should be corrosion resistant for a specified application or environment. The selection of a particular stainless steel "type" and "grade" must initially meet corrosion resistance requirements. Additional mechanical or physical properties may also need to be considered to achieve the overall service performance requirements.
